Image Formation Optics
Assembly
(21)

- Barrel Hold Lens Elements
- Base Hold Sensors
- Barrel Slides In Base To Focus

FIG. 3E

FIG. 3F1

FIG. 3F2

DOF Determination Of Image Formation Optics

- At each distance, find frequency where MTF drops to 0.3
 - Rule of thumb for bar code decoding
 - Depends on code, speed, etc, etc - must test

- BUT: limited by sampling requirement
 - Software needs ~1.6 pixels on narrow code element
 - Limits decode ability regardless of optics
 - Exact value is rule of thumb and flexible (1.4 – 1.6)

FIG. 3G

Depth Of Field

- Face To 8" For 13.5 Mil
- Optics Resolve 4 Mil Somewhere
- Decodes 5 Mil Somewhere
- No Moving Elements

FIG. 413

Multi-Mode Illumination Subsystem

- Three Modes Of Illumination
 - (1) Wide-Area For "Near" Object (0 mm-100 mm)
 - (2) Wide-Area For "Far" Object (100 mm-200 mm)
 - (3) Narrow-Area For "Near" Object (30 mm-100 mm)

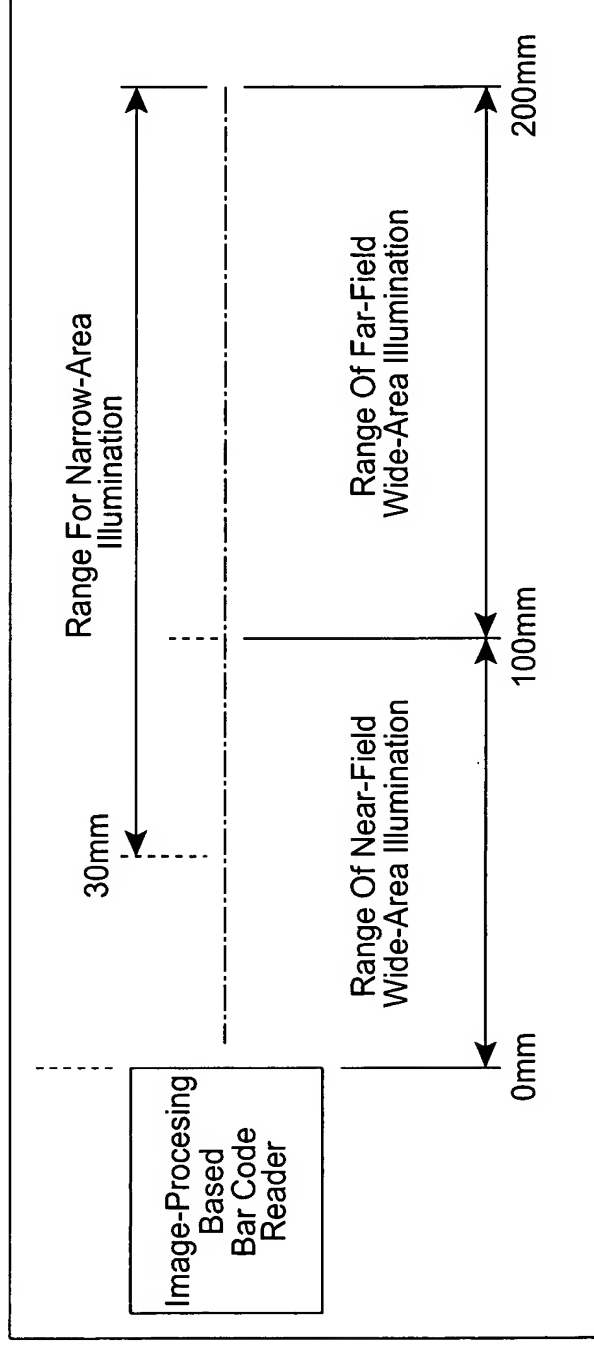

FIG. 5A1

Illumination Design Goals For First Illustrative Embodiment

- Wide-Area Illumination Modes
 - Match FOV and DOF (45°, 200mm)
 - Sufficient power density on target
 - Pixel value > 80 DN at far field center
 - Achieve sufficient uniformity (center:edge = 2:1 max)
 - Use as few LEDs as possible
- Narrow-Area Illumination Mode
 - Line usable beginning 40 mm from window
 - Match FOV and DOF
 - Sufficient power density on target
 - Sufficiently thin line
 - Height < 10 mm at far field

FIG. 5A2

LEDs For Narrow-Area Illumination

- Linear Illumination: Osram LS E655
 - 633 nm InGaAlP
 - 60° Lambertian Emittance
 - 6.75 mW Total Output Power (Typical Conditions)
 - \$0.18 Each In 50k

FIG. 5C1

FIG. 5C2

LED Arrangements For Near-Field And Far-Field Wide Area Illumination Arrays And Narrow-Area Illumination Arrays

FIG. 5B

Cylindrical Lenses For Narrow-Area Illumination Array

- First Surface Curved Vertically To Create Line
- Second Surface Curved Horizontally To Control Line Height

FIG. 5C3

FIG. 5C4

Linear Illumination Profiles

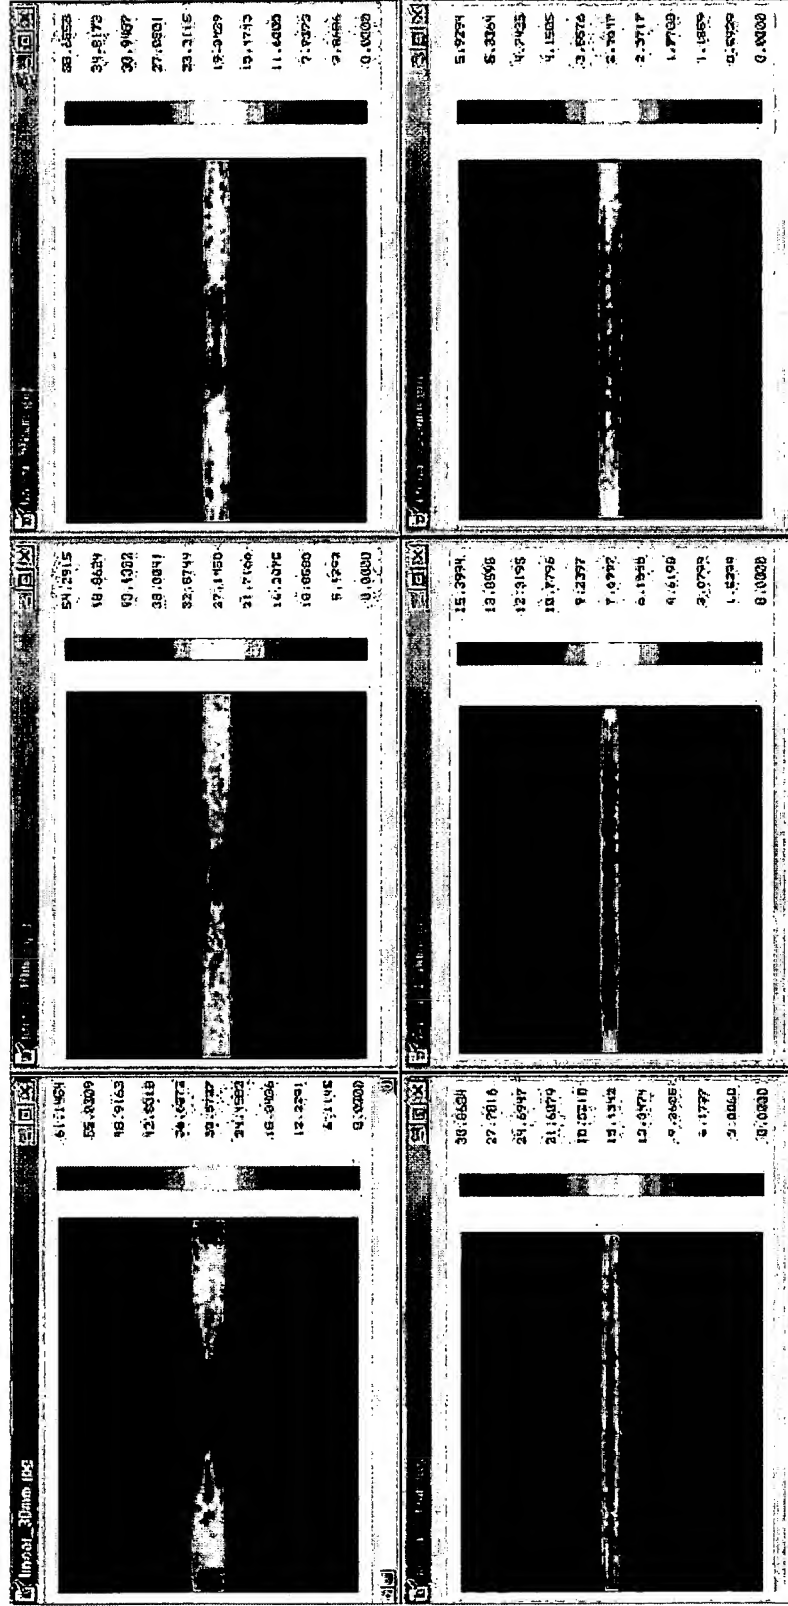

FIG. 5C5

Area LEDs

- Area Illumination: Osram LS E67B
 - 633 nm InGaIP
 - 120° Lambertian Emittance
 - 11.7 mW Total Output Power (Typical Conditions)
 - \$0.18 each In 50k

FIG. 5D1

FIG. 5D2

Far Area Lenses

- Plano Convex Lenses In Front Of Far Field LEDs
- Light Aimed By Angling Lenses
 - Even Out Distribution Across FOV Throughout DOF
 - Satisfy Center: Edge = 2:1 Max Criterion
 - Allows LEDs To Be Mounted Flat

- All Lenses CNCed In Single Piece Of Plastic

Wide-Area Illumination Profiles (Near)

FIG. 5D5

Wide-Area Illumination Profiles (Far)

FIG. 5D6

Pixel Value Calculation

- Pixel Value Calculation For Center Of Far-Field Shows Sufficient Signal (> 80DN)

Description		Value	Unit
Sensor Power Density	Target Power Density	4	$\mu\text{W}/\text{mm}^2$
	Surface Reflection	0.6	#
	Optical Transmittance	0.9	
	F-Number	9	
Signal	Pixel Power Density	0.007	$\mu\text{W}/\text{mm}^2$
	CMOS Internal Gain	4.5	#
	Amplification Gain	20	dB
	Integration Gain	5	ms
	Sensor Responsivity	1.8	$\text{V} / (\text{lx s})$
	Wavelength	633	nm
	Photopic Luminous Efficiency	0.238	lm / W
	Signal Out Of Sensor	0.439	V
	A/D Range Max	1.3	V
	A/D Range Min	0.0	
Value Pixel	Pixel Value (0-255)	86	DN

FIG. 5D7

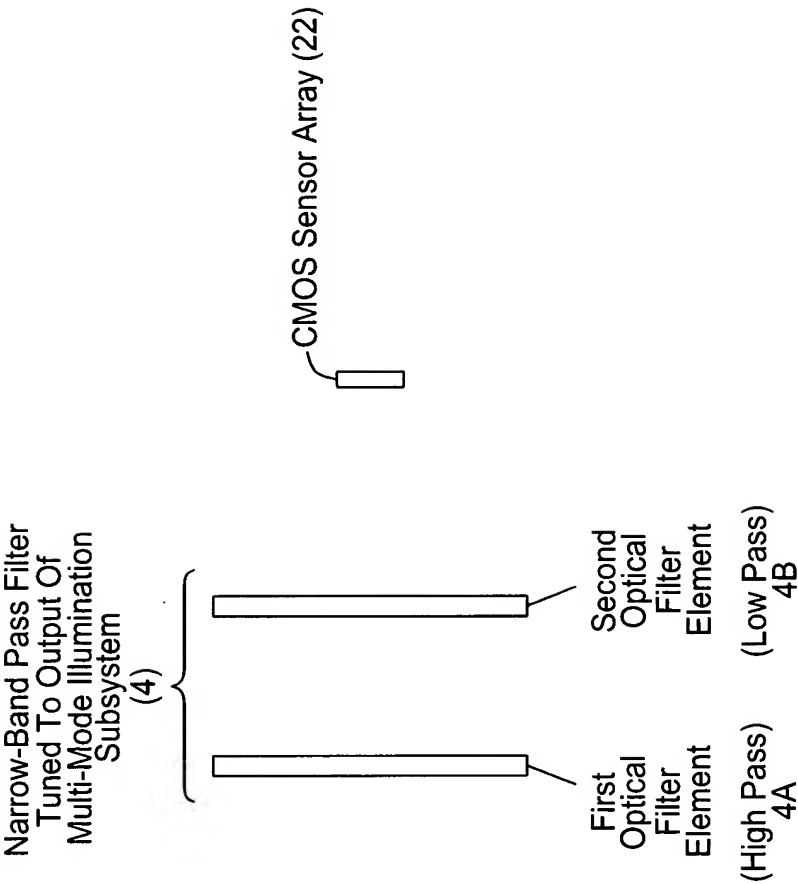

FIG. 6A1

Red Window And Low-Pass Filter Characteristics

- Must Bandpass Return Light Against Ambient
 - Red Window + Low Pass Filter
 - Restricts Range To 620nm – 700nm

FIG. 8

FIG. 9

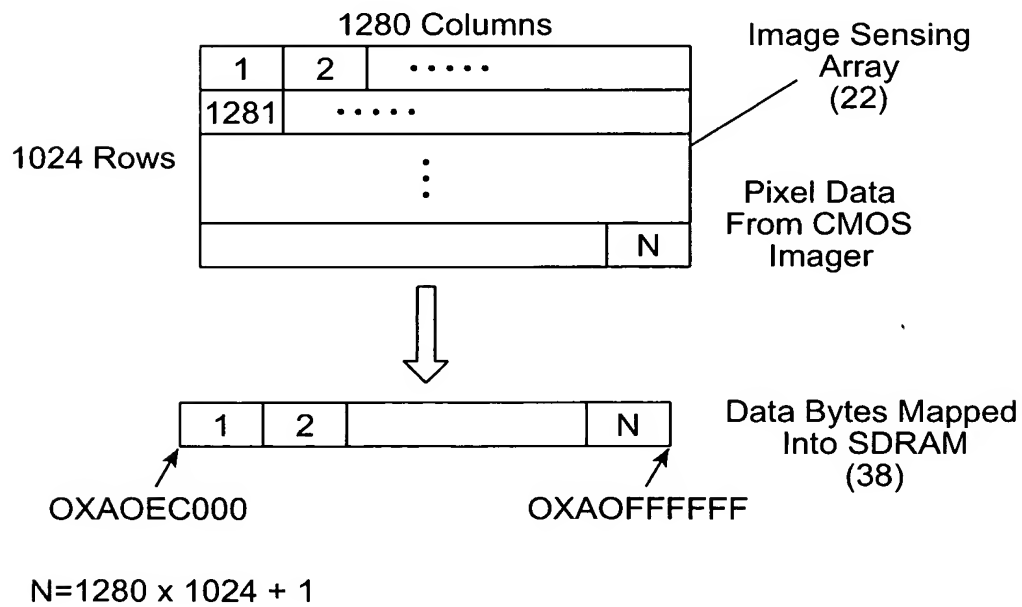

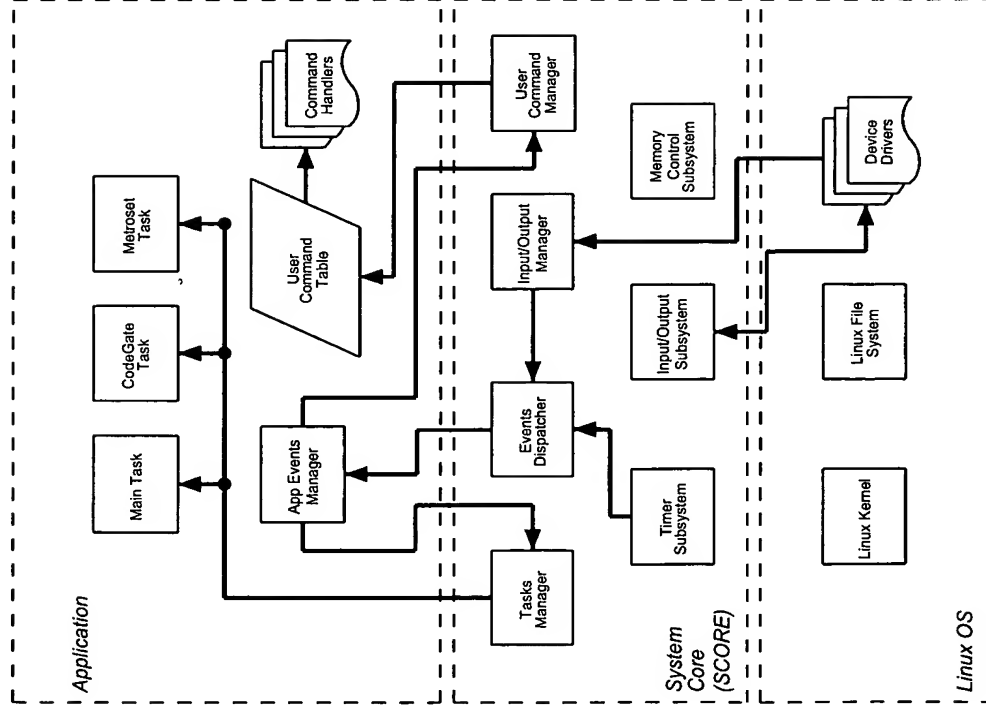

FIG. 10

Software Block Diagram

3-Tier Software Architecture:

- Linux OS
- System Core (SCORE) Software
- Product Application Software

FIG. 11

Events Dispatcher

Provides a means of signaling and delivering events to the App Events Manager

(pointer to App Events Manager is provided at the SCORE initialization)

```
int  
ScoreSignalEvent(int event_id,      /* Input: event id */  
                 void * p_par);    /* Input: pointer to the event's parameters */
```

App Events Manager is responsible for processing the event: It can start a new task, or stop currently running task, or do something or nothing and simply ignore the event.

FIG. 12A

Examples of System-Defined Events

SCORE_EVENT_POWER_UP

Signals the completion of the system start-up. No parameters.

SCORE_EVENT_TIMEOUT

Signals the timeout of the logical timer. Parameter: pointer to timer id.

SCORE_EVENT_UNEXPECTED_INPUT

Signals that the unexpected input data is available. Parameter: pointer to connection id.

SCORE_EVENT_TRIG_ON

Signals that the user pulled the trigger. No parameters.

SCORE_EVENT_TRIG_OFF

Signals that the user released the trigger. No parameters.

SCORE_EVENT_OBJECT_DETECT_ON

Signals that the object is positioned under the camera. No parameters.

SCORE_EVENT_OBJECT_DETECT_OFF

Signals that the object is removed from the field-of view of the camera. No parameters.

SCORE_EVENT_EXIT_TASK and SCORE_EVENT_ABORT_TASK

Signal the end of the task execution. Parameter: pointer to the UTID.

FIG. 12B

Tasks Manager

Provides a means of executing and stopping application specific tasks (threads)

```
typedef void *
(*TASK_FUNC)(void *params);

/* Return: pointer to the set of returned parameters */
/* Input: set of input parameters */

int
ScoreStartTask(TASK_FUNC task_func, /* Return: 0 if successful, otherwise error code */
               int task_id, /* Input: pointer to the task's main function */
               void *task_params, /* Input: id assigned to the task by application */
               int task_owner, /* Input: parameters passed to the task's main function */
               int task_priority, /* Input: connection id of the task's owner */
               size_t stacksize, /* Input: task's priority (must be 0 for now) */
               size_t heapsize, /* Input: size of the stack, or 0 for default size */
               UTID *p_utid); /* Input: size of the heap, or 0 for default size */
                               /* Output: unique task identifier */

BOOL /* Return: TRUE if it kills the task, or FALSE if the task was not found */
ScoreKillTask(UTID pthread_id) /* Input: unique task identifier */
```

FIG. 12C

Input / Output Manager

- High priority thread running in the background and monitoring activities of the external devices and user connections
- Signals appropriate events to the application when such activities are detected

FIG. 12D

Input / Output Subsystem

Provides a means of creating and deleting input/output connections...

```
int
ScorelomngrCreateConnection(int conn_type,    /* Return: connection id if successful, otherwise (-1) */
    int fd,    /* Input: connection type */
    int conn_state,    /* Input: file descriptor of a device or a socket */
    void *properties);    /* Input: initial state of the connection, the value controlled by application */

int
ScorelnitRS232(char *full_name,    /* Return: connection id if successful, otherwise (-1) */
    RS232_PROP *rs232_prop);    /* Input: full name of the device, such as "/dev/ttyS0" */
    /* Input: RS232 parameters */
```

FIG. 12E1

Input / Output Subsystem

...and communicating with the outside world

```
int
ScorelomngrGetData(int connection_id, /* Return: number of bytes received */
                  /* Input: connection id, or -1 for the task owner */
                  char *input_buffer, /* Input: pointer to the input buffer */
                  int min_len, /* Input: minimum number of bytes to receive */
                  int max_len, /* Input: maximum number of bytes to receive */
                  BOOL echo, /* Input: TRUE if data should be echoed back to device, otherwise FALSE */
                  int timeout_ms); /* Input: If not 0, number of milliseconds to wait */

int
ScorelomngrSendData(int connection_id, /* Return: 0 if successful, or (-1) in case of error */
                  /* Input: connection id */
                  char *p_data, /* Input: pointer to the data buffer */
                  int len); /* Input: number of bytes to send */

void
ScorelomngrSendStream(int stream_type, /* Input: type of output stream */
                    char *p_data, /* Input: pointer to the data buffer */
                    int len); /* Input: number of bytes to send */
```

FIG. 12E2

Timer Subsystem

Provides a means of creating, deleting...

```
int                                     /* Return: timer id if successful, otherwise (-1) */
ScoreCreateTimer(int flags);  /* Input: optional SCORE_TIMER_CONTINUOUS */

void

ScoreDeleteTimer(int timer_id);      /* Input: timer id, must be >= 0 */

int                                     /* Return: 0 if successful, otherwise (-1) */
ScoreStartTimer(int timer_id,  /* Input: timer id */
                int time_ms);  /* Input: timer value, in ms */

int                                     /* Return: 0 if successful, otherwise (-1) */
ScoreStopTimer(int timer_id); /* Input: timer id */
```

FIG. 12F1

Timer Subsystem

...and utilizing logical timers

```

BOOL                                     /* Return: TRUE if the timer timed out, otherwise FALSE */
ScoreTimerTimedOut(int timer_id);      /* Input: timer id */

int                                     /* Return: time (in ms) left before the timer times out, or (-1) in case of error */
ScoreGetTimeLeft(int timer_id);        /* Input: timer id */

int                                     /* Return: time (in ms) gone since the timer has been started (or restarted), or (-1) in case of error */
ScoreGetTime (int timer_id);          /* Input: timer id */

BOOL                                     /* Return: TRUE if timer is stopped, otherwise FALSE */
ScoreIsTimerStopped(int timer_id);    /* Input: timer id */
```

FIG. 12F2

Memory Control Subsystem

Provides a thread-level dynamic memory management (the interfaces fully compatible with standard dynamic memory management functions)...

```
void *                               /* Return: pointer to the allocated memory if successful, otherwise NULL */  
ScoreMalloc(size_t size);           /* Input: size, in bytes, of the needed memory */  
  
void  
ScoreFree(void *mem);              /* Input: pointer to the memory to be freed */
```

FIG. 12G1

Memory Control Subsystem

...as well as a means of buffering the data

```
int
ScoreCreateOutpMem(SCORE_OUTP_MEM *p_outp_mem);          /* Return: 0 if successful */
                                                         /* Input: pointer to buffered memory structure */

void
ScoreDestroyOutpMem(SCORE_OUTP_MEM *p_outp_mem);          /* Input: pointer to buffered memory structure */

int
ScoreWriteToOutpMem (SCORE_OUTP_MEM *p_outp_mem,         /* Return: 0 if successful */
                    void *p_data,                          /* Input: pointer to buffered memory structure */
                    size_t len);                          /* Input: pointer to the data to be buffered up for output */
                                                         /* Input: size of the data, in bytes */

int
ScoreSendDataFromOutpMem(int connection_id,              /* Return: 0 if successful */
                         SCORE_OUTP_MEM *p_outp_mem);     /* Input: id of the connection to send the data to */
                                                         /* Input: pointer to buffered memory structure */

int
ScoreSendStreamFromOutpMem(int stream_type,              /* Return: 0 if successful */
                         SCORE_OUTP_MEM *p_outp_mem);     /* Input: type of output stream */
                                                         /* Input: pointer to buffered memory structure */
```

FIG. 12G2

User Commands Manager

Provides a standard way of entering user commands and executing application modules responsible for handling them

(pointer to User Commands Table is provided at the SCORE initialization)

```
int
ScoreCmdManager(void *params);

rc = ScoreStartTask(ScoreCmdManager,
    CMDMNGR_TASK_ID,
    NULL,
    0,
    connection_id,
    0,
    (64 * 1024),
    (512 * 1024),
    &cmdmngn_utid);

/* Input: user command manager task */
/* Input: id assigned to the commands manager */

/* Input: connection id of the owner */
/* Input: priority */
/* Input: stack size */
/* Input: heap size */
/* Output: unique task identifier */
```

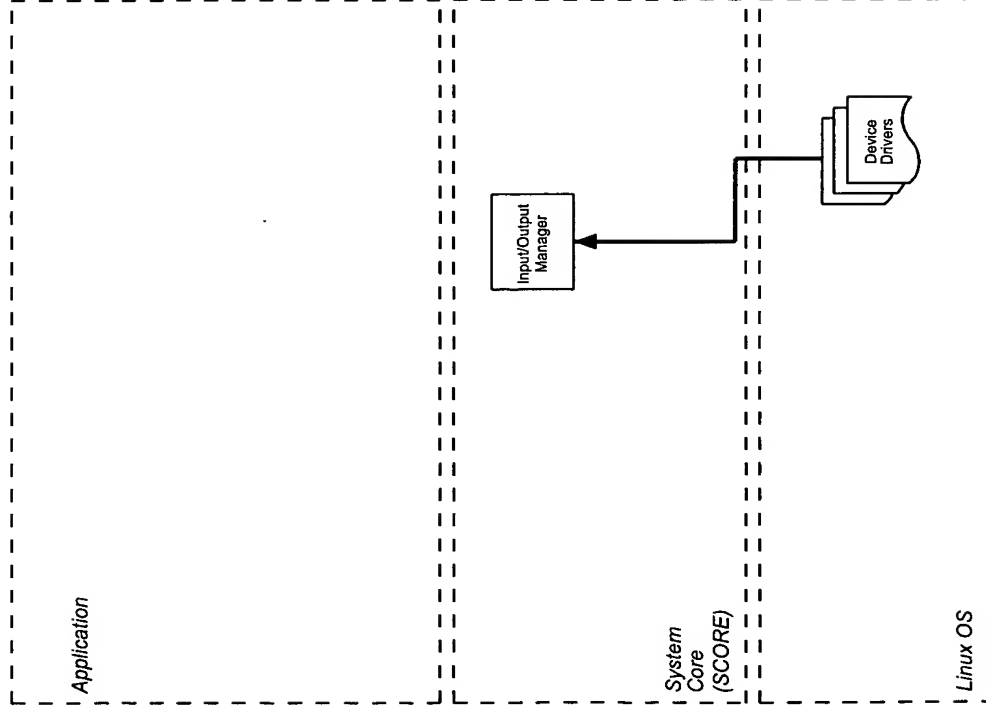

FIG. 12H

Device Drivers

- Trigger driver -- establishes software connection with the hardware trigger
- Image acquisition driver -- implements image acquisition functionality
- IR driver -- implements object detection functionality

FIG. 12I

Example of Flow of Events

- User points the scanner towards a barcode label
- Object is detected
- The IR device driver wakes up the Input/Output Manager

FIG. 13A

Example of Flow of Events

- The Input/Output Manager posts the SCORE_OBJECT_DETECT_ON event

FIG. 13B

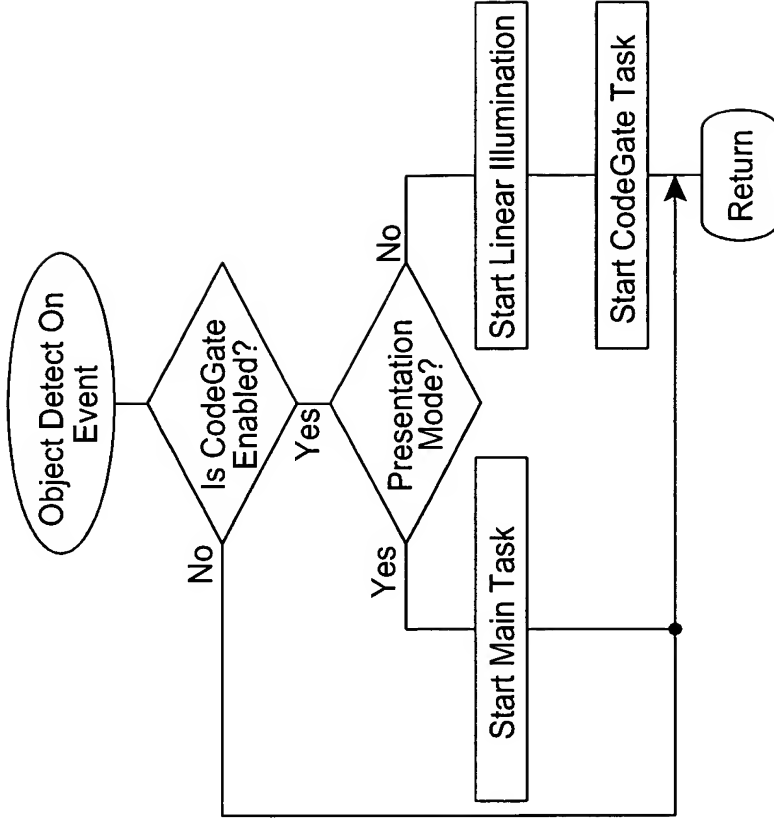

Example of Flow of Events

- The Events Dispatcher passes the SCORE_OBJECT_DETECT_ON event to the application

FIG. 13C

Example of Flow of Events

- The SCORE_OBJECT_DETECT_ON event handling routine starts linear illumination and executes the CodeGate Task

FIG. 13D

Example of Flow of Events

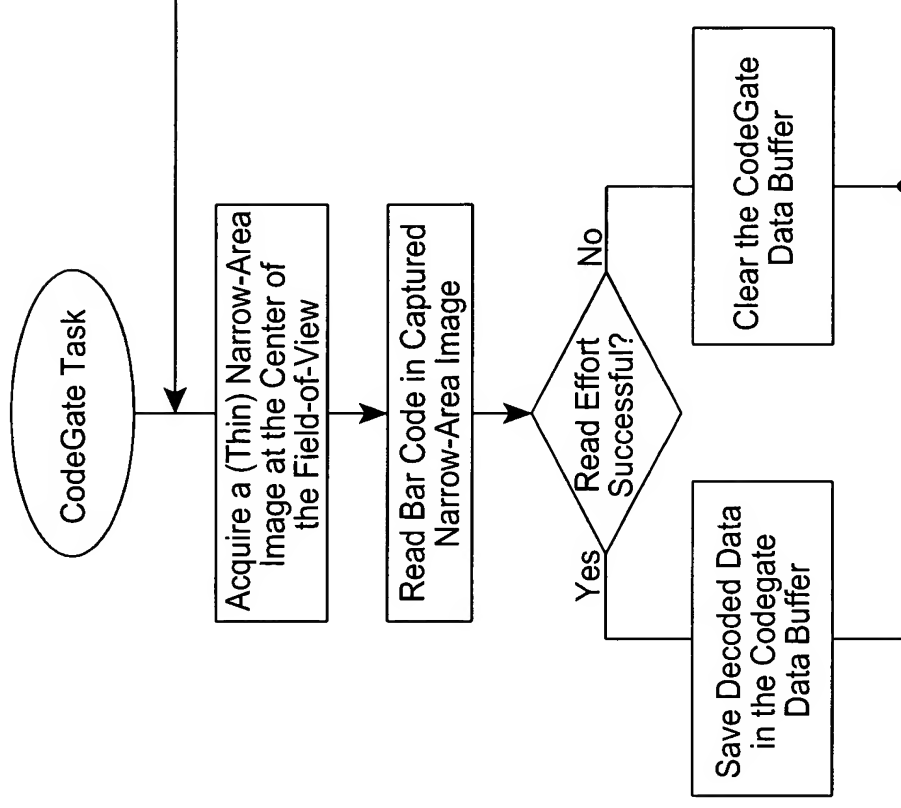

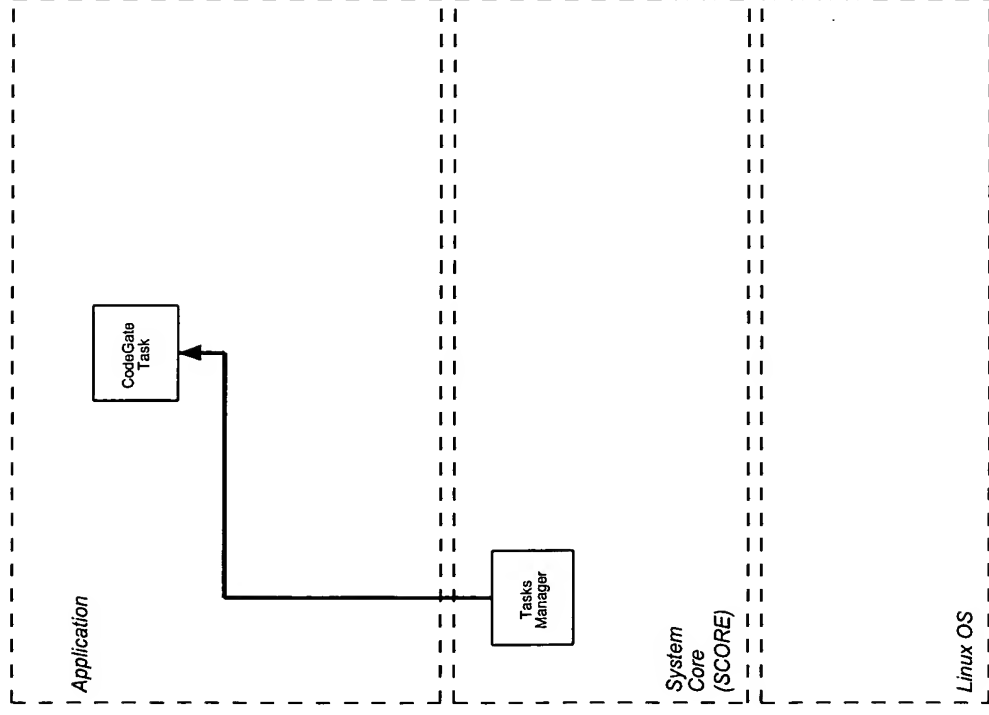

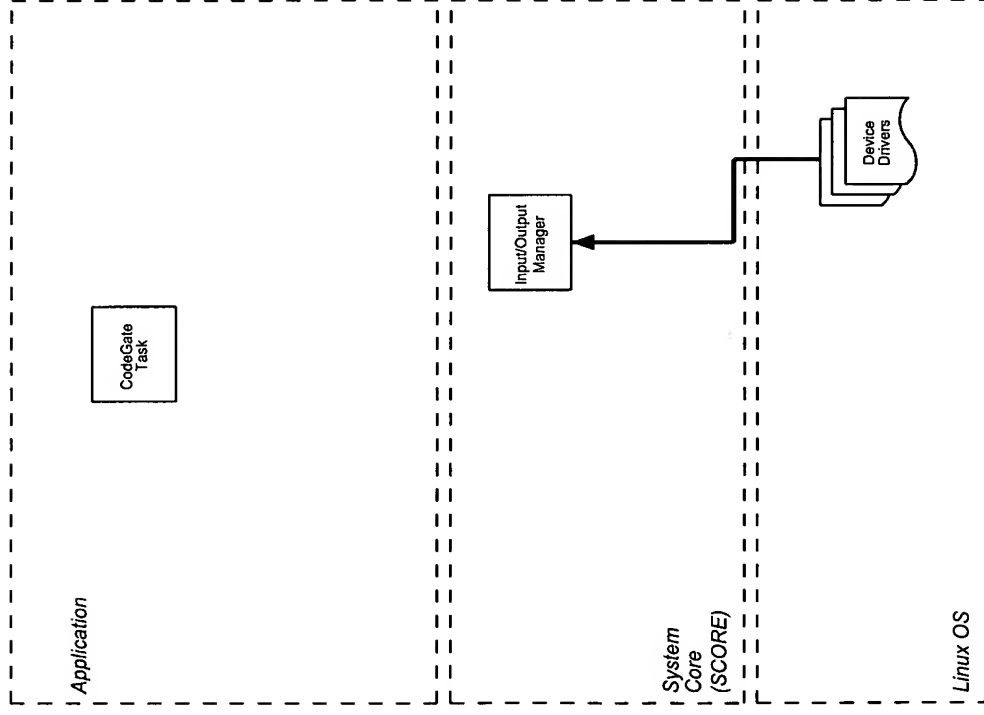

FIG. 13E

Example of Flow of Events

- User pulls the trigger
- The trigger device driver wakes up the Input/Output Manager

FIG. 13F

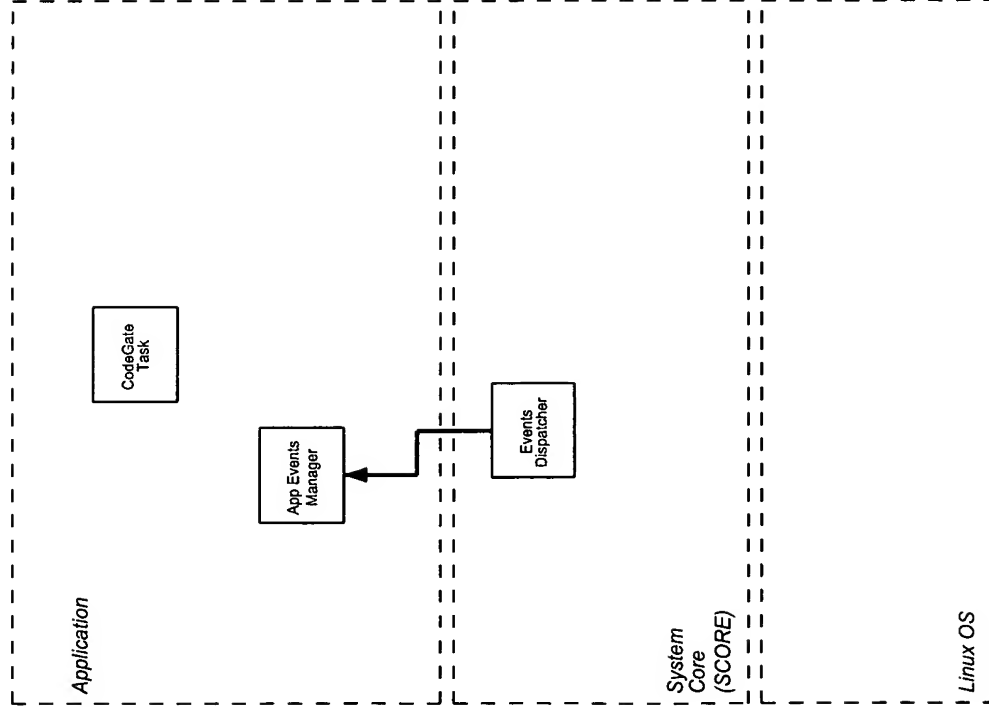

Example of Flow of Events

- The Input/Output Manager posts the SCORE_TRIGGER_ON event

FIG. 13G

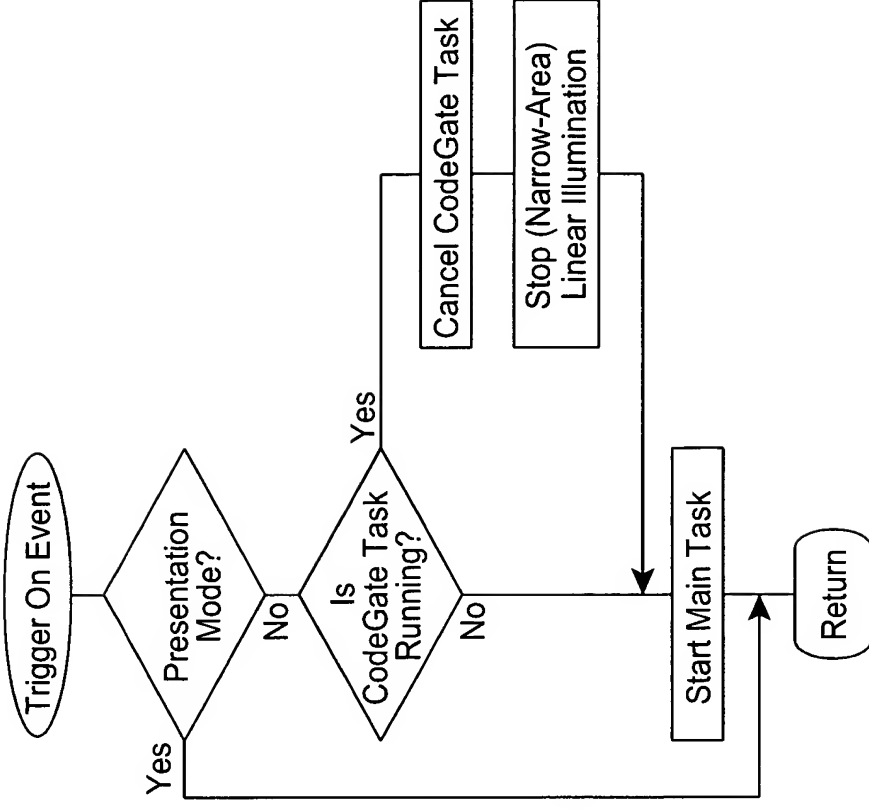

Example of Flow of Events

- The Events Dispatcher passes the SCORE_TRIGGER_ON event to the application

FIG. 13H

Example of Flow of Events

- The SCORE_TRIGGER_ON event handling routine stops linear illumination, cancels the CodeGate Task, and executes the Main Task

Example of Flow of Events

- The decoded data is sent to the user

FIG. 13L

METHOD OF ILLUMINATING OBJECTS WITHOUT
SPECULAR REFLECTION

STEP A: USE THE AUTOMATIC LIGHT EXPOSURE MEASUREMENT AND CONTROL SUBSYSTEM TO MEASURE THE LIGHT LEVEL TO WHICH THE CMOS IMAGE SENSING ARRAY IS EXPOSED.

STEP B: USE THE AUTOMATIC IR-BASED OBJECT PRESENCE AND RANGE DETECTION SUBSYSTEM TO MEASURE THE PRESENCE AND RANGE OF THE OBJECT IN EITHER THE NEAR OR FAR FIELD PORTION OF THE FIELD OF VIEW (FOV) OF THE SYSTEM.

STEP C: USE THE DETECTED RANGE AND THE MEASURED LIGHT EXPOSURE LEVEL TO DRIVE BOTH THE UPPER AND LOWER LED SUBARRAYS ASSOCIATED WITH EITHER THE NEAR OR FAR FIELD WIDE AREA ILLUMINATION ARRAY.

STEP D: CAPTURE A WIDE-AREA IMAGE AT THE CMOS IMAGE SENSING ARRAY USING THE ILLUMINATION FIELD PRODUCED DURING STEP C.

STEP E: RAPIDLY PROCESS THE CAPTURED WIDE-AREA IMAGE DURING STEP D TO DETECT THE OCCURANCE OF HIGH SPATIAL-INTENSITY LEVELS IN THE CAPTURED WIDE-AREA IMAGE, INDICATIVE OF A SPECULAR REFLECTION CONDITION.

STEP F:

IF A SPECULAR REFLECTION CONDITION IS DETECTED IN THE PROCESSED WIDE-AREA IMAGE, THEN DRIVE ONLY THE UPPER LED SUBARRAY ASSOCIATED WITH EITHER THE NEAR FIELD OR FAR FIELD WIDE AREA ILLUMINATION ARRAY.

IF A SPECULAR REFLECTION CONDITION IS NOT DETECTED IN THE PROCESSED WIDE-AREA IMAGE, THEN USE THE DETECTED RANGE AND THE MEASURED LIGHT EXPOSURE LEVEL TO DRIVE BOTH THE UPPER AND LOWER LED SUBARRAYS ASSOCIATED WITH EITHER THE NEAR FIELD OR FAR FIELD WIDE AREA ILLUMINATION ARRAY.

FIG. 13M1

STEP G: CAPTURE A WIDE-AREA IMAGE AT THE CMOS IMAGE SENSING ARRAY USING THE ILLUMINATION FIELD PRODUCED DURING STEP F.

STEP H: RAPIDLY PROCESS THE CAPTURED WIDE-AREA IMAGE DURING STEP G TO DETECT THE OCCURANCE OF HIGH SPATIAL-INTENSITY LEVELS IN THE CAPTURED WIDE-AREA IMAGE, INDICATIVE OF A SPECULAR REFLECTION CONDITION.

STEP I:

IF A SPECULAR REFLECTION CONDITION IS STILL DETECTED IN THE PROCESSED WIDE-AREA IMAGE, THEN DRIVE THE OTHER LED SUBARRAY ASSOCIATED WITH EITHER THE NEAR FIELD OR FAR FIELD WIDE AREA ILLUMINATION ARRAY.

IF A SPECULAR REFLECTION CONDITION IS NOT DETECTED IN THE PROCESSED WIDE-AREA IMAGE, THEN DRIVE USE THE DETECTED RANGE AND THE MEASURED LIGHT EXPOSURE LEVEL TO DRIVE THE SAME LED SUBARRAY (AS IN STEP C) ASSOCIATED WITH EITHER THE NEAR FIELD OR FAR FIELD WIDE AREA ILLUMINATION ARRAY.

STEP J: CAPTURE A WIDE-AREA IMAGE AT THE CMOS IMAGE SENSING ARRAY USING THE ILLUMINATION FIELD PRODUCED DURING STEP I.

STEP K: RAPIDLY PROCESS THE CAPTURED WIDE-AREA IMAGE DURING STEP J TO DETECT THE ABSENCE OF HIGH SPATIAL-INTENSITY LEVELS IN THE CAPTURED WIDE-AREA IMAGE, CONFIRMING THE ELIMINATION OF THE ONCE DETECTED SPECULAR REFLECTION CONDITION.

FIG. 13M2

STEP L:

IF NO SPECULAR REFLECTION CONDITION IS DETECTED IN THE PROCESSED WIDE-AREA IMAGE AT STEP K, THEN PROCESS THE WIDEAREA IMAGE USING MODE(S) SELECTED FOR THE MULTI-MODE IMAGEPROCESSING BAR CODE READING SUBSYSTEM.

IF A SPECULAR REFLECTION CONDITION IS STILL DETECTED IN THE PROCESSED WIDE-AREA IMAGE, THEN RETURN TO STEP A REPEAT STEPS A THROUGH K.

FIG. 13M3

Symbologies Readable By Multi-Mode Bar Code Symbol Reading Subsystem

(1) Code 128	(2) Code 39	(3) I2of5
(4) Code93	(5) Codabar	(6) UPC/EAN
(7) Telepen	(8) UK-Plessey	(9) Trioptic
(10) Matrix 2of5	(11) Airline 2of5	(12) Straight 2of5

FIG. 14

Modes of Operation of Multi-mode Bar Code Reading Subsystem

- Automatic – Look for multiple barcodes incrementally and continue looking until entire image is processed

- Manual – Look for a programmable number of barcodes starting from center of image

- NoFinder – Look for one barcode in picket-fence orientation starting from center of image

- OmniScan – Look for one barcode along pre-determined orientations

- ROI-Specific Method – Look for bar code at specific region of interest (ROI) in captured image

FIG. 15

Setup And Cleanup Flow-Chart

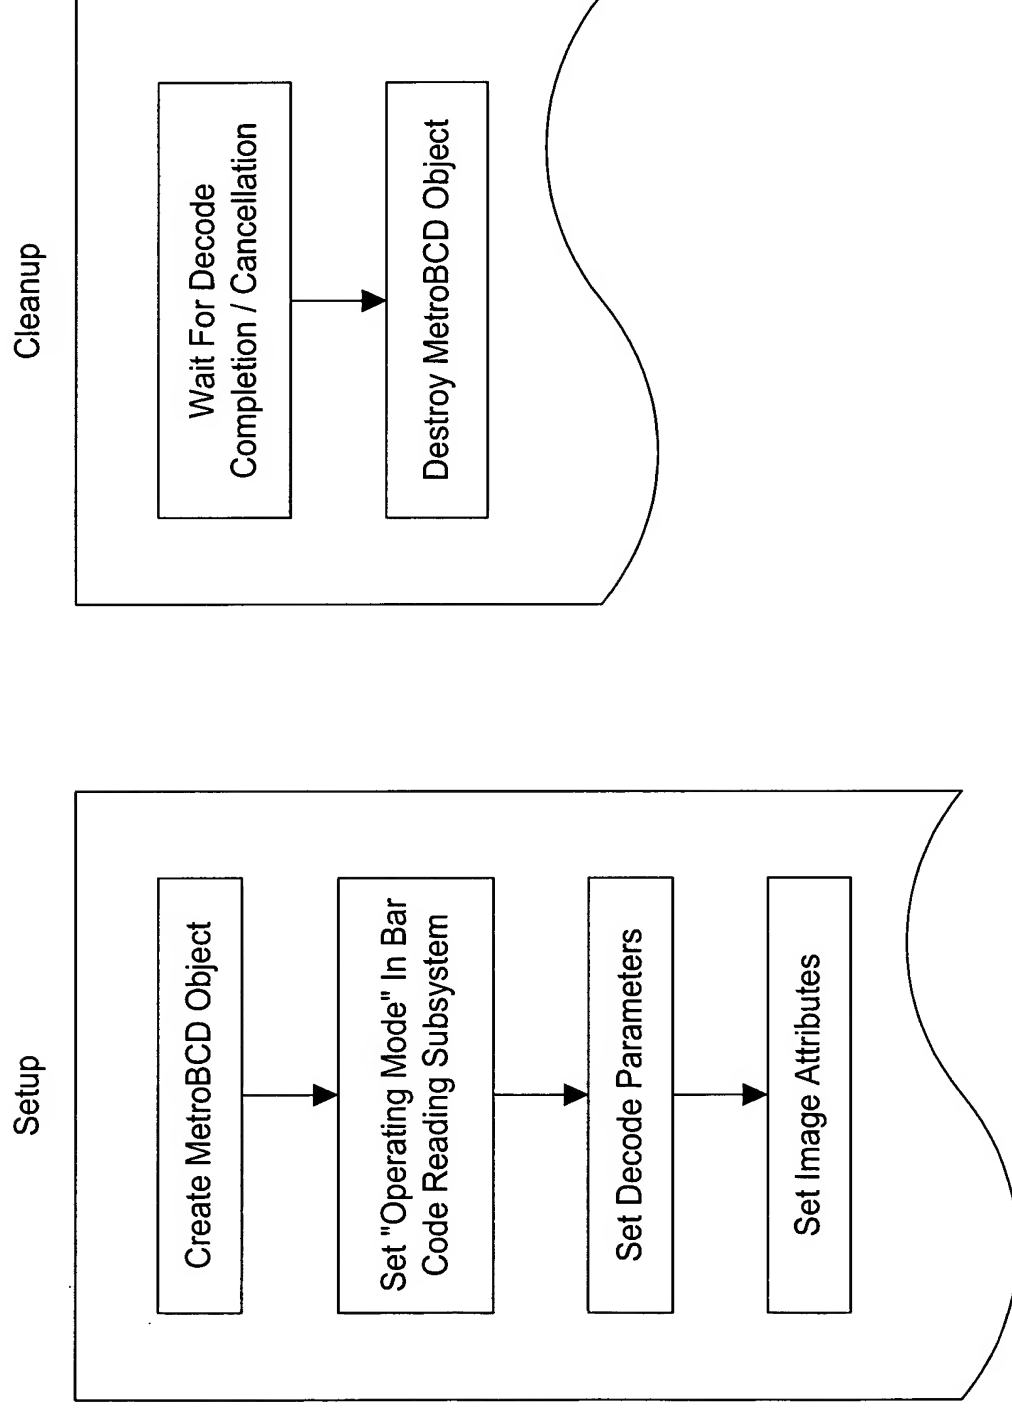

FIG. 16

Summary Of Automatic Events

FIG. 17A

The flowchart illustrates a complex algorithm for edge detection and ROI processing, organized into several main stages:

- Initialization and Setup (A-C):**
 - A:** Reset Finder / Marker/ Decoder.
 - B:** Update image line number.
 - C:** Invoke "Pause Checker".
 - C1:** Decision to "Abort?". If yes, proceed to "Stop".
- Feature Vector Calculation (D-M):**
 - D:** Initialize "Feature Vector" (Fv).
 - E:** Invoke "Pause Checker".
 - F:** Decision to "Abort?". If yes, proceed to "Stop".
 - G:** Calculate average line intensity.
 - H:** Decision: Intensity < Background? If yes, proceed to "Find left+right most foreground pixels" (I).
 - I:** Find left+right most foreground pixels.
 - J:** Apply simple edge-detection operator.
 - K:** Decision: Output > Threshold? If yes, proceed to "Calculate edge strength and direction" (L).
 - L:** Calculate centroid of "edgels".
 - M:** Perform "histogram" calculations.
 - N:** Update Fv with edgels + centroid + histogram.
 - O:** Decision: End of line? If yes, proceed to "Line had edgel?" (P).
 - P:** Decision: Line had edgel? If yes, skip 'n' lines (Q) and skip 'm' lines (R).
 - Q:** Skip 'n' lines (m < n).
 - R:** Skip 'm' lines (m < n).
 - S:** Decision: All lines processed? If yes, proceed to "Invoke 'Pause Checker'" (T).
 - T:** Invoke "Pause Checker".
 - U:** Decision to "Abort?". If yes, proceed to "Stop".
- ROI Processing and Scanning (V-W):**
 - V:** Count unidirectional edgels.
 - W:** Decision: # / edgels > Thresh? If yes, proceed to "Increment # of ROIs" (X).
 - X:** Increment # of ROIs.
 - Y:** Update finder line number.
 - Z:** Decision: ROI in progress? If yes, proceed to "Invoke 'Pause Checker'" (AA).
 - AA:** Invoke "Pause Checker".
 - BB:** Decision to "Abort?". If yes, proceed to "Mark best Fv in 8-connected neighborhood" (CC).
 - CC:** Mark best Fv in 8-connected neighborhood.
 - DD:** Determine orientation.
 - EE:** Find smallest & widest feature size.
 - GG:** Find ROI bounds using "Intensity variance".
 - HH:** Decision: Part of diff ROI? If yes, proceed to "This ROI smaller?" (II).
 - II:** Decision: This ROI smaller? If yes, discard this ROI (JJ).
 - JJ:** Discard this ROI.
 - KK:** Decision: All ROIs processed? If yes, proceed to "ROI marked?" (LL).
 - LL:** Decision: ROI marked? If yes, proceed to "Calculate # of scanlines" (MM).
 - MM:** Calculate # of scanlines.
- Scanning and Decoding (NN-XX):**
 - NN:** Decision: ROI marked? If yes, proceed to "Calculate # of scanlines" (MM).
 - OO:** Invoke "Pause Checker".
 - PP:** Calculate 1st and 2nd derivatives of scan-data.
 - QQ:** Filter scan-data and collect bars and space counts.
 - RR:** Decode bar-space counts.
 - SS:** Decision: Decoded? If yes, proceed to "Stacked or partial?" (UU).
 - UU:** Decision: Stacked or partial? If yes, proceed to "Invoke 'Decode Saver'" (VV).
 - VV:** Invoke "Decode Saver".
 - WW:** Decision: All ROIs processed? If yes, proceed to "Update decoder line number" (XX).
 - XX:** Update decoder line number.
 - YY:** Decision: Image complete? If yes, proceed to "Stop".
- Tracking and Finding (ZZ):**
 - ZZ:** Increment scanline.
 - AAA:** Decision: All filters tried? If yes, proceed to "Stop".

The flowchart includes various decision points (diamonds) and process steps (rectangles), with loops and exits indicated by arrows. The final outcome is either "Stop" or "Image complete?".

FIG. 17B

Step 1: Search for ROIs: Low resolution processing

FIG. 18A

Step 2: Search for ROIs: Partition image

- Image overlaid with XY grid
- Each block formed by grids has an associated "feature vector" (Fv)
- Feature vectors are analyzed for the presence of parallel lines
- All feature vector calculations are performed on the low-resolution image

FIG. 18B

Step 3: Search for ROIs: Create feature vectors

Fv =

- Gradient vectors
- Edge density
- Number of parallel edge vectors
- Centroid of edgels
- Intensity variance
- Histogram of intensities

FIG. 18C

Step 4: Mark ROIs: Examine feature vectors

- High edge density
- Large number of parallel edge vectors
- Large intensity variance

FIG. 18D

Step 5: Mark ROIs: Calculate barcode orientation

- Within each “feature vector” block the barcode is traversed (“sliced”) at different angles
- The slices are matched with each other based on “least mean square error”
- The correct orientation is that angle that matches in a “mean square error” sense every slice of the barcode

FIG. 18E

Step 5: Mark ROIs: Calculate barcode orientation

High mean square error
between slices

Lowest mean square error
between slices
- Correct orientation

FIG. 18F

Step 6: Mark ROIs: Mark four corners of barcode

- From here on all operations are performed on the full-resolution image
- Barcode is traversed in either direction starting from center of block
- Using intensity variance the extent of modulation is detected (1 & 2)
- Starting from 1 & 2 and moving perpendicular to barcode orientation the four corners are determined (3, 4, 5, 6)
- 3, 4, 5, 6 define the ROI

FIG. 18G

Step 7: Decode ROIs: Update feature vectors

- Histogram component of F_v is updated while traversing barcode
- Estimate of Black-to-White transition is calculated
- Estimate of narrow & wide elements are calculated

FIG. 18H

Step 8: Decode ROIs: Look for zero-crossings

- Barcode image is median filtered in a direction perpendicular to barcode orientation
- Second derivative zero-crossings define edge transitions
- Zero-crossing data used only for detecting the edge transitions
- B/W transition estimates put upper and lower bounds to bar and space gray levels

FIG. 18I

Step 9: Decode ROIs: Create bar and space pattern

- Edge transition is modeled as a ramp
- Edge transition is assumed to be 1-pixel wide
- Edge transition location is determined at the sub-pixel level
- Bar and space counts are gathered using edge transition data

FIG. 18J

Step 10: Decode ROIs: Decode bar and space pattern

- Bar and space data framed with “borders”
- Bar and space data decoded using existing Metrologic laser-scanner algorithms

PROGRAMMABLE MODES OF BAR CODE SYMBOL READING
OPERATION WITHIN THE HAND-SUPPORTABLE DIGITAL IMAGING-
BASED BAR CODE SYMBOL READER OF THE PRESENT INVENTION

Programmed Mode of System Operation No.1: Manually-Triggered Single-Attempt 1D Single-Read Mode Employing the No-Finder Mode of Operation

Programmed Mode of System Operation No.2: Manually-Triggered Multiple-Attempt 1D Single-Read Mode Employing the No-Finder Mode of Operation

Programmed Mode of System Operation No.3: Manually-Triggered Single-Attempt 1D/2D Single-Read Mode Employing the No-Finder And The Automatic Or Manual Modes of Operation

Programmed Mode of System Operation No.4: Manually-Triggered Multiple-Attempt 1D/2D Single-Read Mode Employing the No-Finder And The Automatic Or Manual Modes of Operation

Programmed Mode of System Operation No.5: Manually-Triggered Multiple-Attempt 1D/2D Multiple-Read Mode Employing the No-Finder And The Automatic Or Manual Modes of Operation

Programmed Mode of System Operation No.6: Automatically- Triggered Single-Attempt 1D Single-Read Mode Employing The No-Finder Mode Of Operation

Programmed Mode of System Operation No.7: Automatically-Triggered Multi-Attempt 1D Single-Read Mode Employing The No-Finder Mode Of Operation

Programmed Mode of System Operation No.8: Automatically-Triggered Multi-Attempt 1D/2D Single-Read Mode Employing The No-Finder and Manual and/or Automatic Modes Of Operation

Programmed Mode of System Operation No.9: Automatically-Triggered Multi-Attempt 1D/2D Multiple-Read Mode Employing The No-Finder and Manual and/or Automatic Modes Of Operation

Programmable Mode of System Operation No. 10: Automatically-Triggered Multiple-Attempt 1D/2D Single-Read Mode Employing The Manual, Automatic or Omniscan Modes Of Operation

Programmed Mode of System Operation No. 11: Semi-Automatic-Triggered Single-Attempt 1D/2D Single-Read Mode Employing The No-Finder And The Automatic Or Manual Modes Of Operation

FIG. 26A

Programmable Mode of System Operation No. 12: Semi-Automatic-Triggered Multiple-Attempt 1D/2D Single-Read Mode Employing The No-Finder And The Automatic Or Manual Modes Of Operation

Semi-Automatic-Triggered Multiple-Attempt 1D/2D Multiple-Read Mode Employing The No-Finder And The Automatic Or Manual Modes Of Decoder Operation; Programmable Mode of Operation No. 13

Programmable Mode of Operation No. 14: Semi-Automatic-Triggered Multiple-Attempt 1D/2D Multiple-Read Mode Employing The No-Finder And The Omniscan Modes Of Operation

Programmable Mode of Operation No. 15: Continuously-Automatically-Triggered Multiple-Attempt 1D/2D Multiple-Read Mode Employing The Automatic, Manual Or Omniscan Modes Of Operation

Programmable Mode of System Operation No. 16: Diagnostic Mode Of Imaging-Based Bar Code Reader Operation

Programmable Mode of System Operation No. 17: Live Video Mode Of Imaging-Based Bar Code Reader Operation

FIG. 26B

Imaging-Based Bar Code Symbol Reading System
With Extended Multi-Mode Illumination Subsystem

• Four Modes Of Illumination

- (1) Wide-Area For "Near" Object (0 mm-100 mm)
- (2) Wide-Area For "Far" Object (100 mm-200 mm)
- (3) Narrow-Area For "Near" Object (0 mm-100 mm)
- (4) Narrow-Area For "Far" Object (100 mm-200 mm)
